Date	29-06-2026
Team ID	23A51A05H9
Project Name	Automated Network Request Management
Maximum Marks	2 Marks

Customer Problem Statement:

Manual corporate leave management processes often face significant challenges in handling time-off requests efficiently, especially during peak holiday seasons or fiscal year-ends. Employees are forced to submit requests through fragmented channels like emails, spreadsheets, or paper forms, leading to tracking delays, operational bottlenecks, and reduced employee satisfaction. Traditional leave management methods rely heavily on human oversight to check team calendars, manually calculate remaining leave balances, and verify date compliance, which increases the administrative burden on HR and management.

In addition, the absence of a centralized digital leave management platform makes it difficult for companies to enforce basic validation rules—such as preventing an employee from selecting an end date that occurs earlier than a start date. Without a unified system, managers lack real-time visibility into their team's availability, making scheduling conflicts common and causing unexpected delays in critical project approvals. These limitations highlight the urgent need for an automated, user-friendly, and scalable solution that can simplify the leave application lifecycle while improving operational efficiency across the organization.

The proposed **Leave Approval System** leverages ServiceNow to digitize the entire time-off workflow from scratch. Built as a custom scoped application, the system enables employees to submit requests digitally, enforces strict instant date validation via client-side scripting, automatically routes approvals to the correct manager using Flow Designer, and fires immediate update notifications upon approval or rejection. This transformation completely eliminates manual processing gaps, eliminates scheduling human errors, and enhances the overall employee experience.
